

SELF-HEALING

Proactive Self-Healing Features Included in All Our Wireless Routers

Module Self-Healing: 20x/HOUR

Our routers check the cellular network status every 3 minutes. Our router automatically scans the tower's bands to optimize network performance and reconnects if the connection is lost. After 3 retries the module automatically reboots.

Router Self-Healing: 3x/HOUR

Our routers confirm internet connectivity by pinging www.google.com 3 times an hour. After 3 failed pings our router automatically reboots.

By pinging www.google.com, we are checking internet connectivity and verifying the DNS.

Scheduled Reboot: 1x/DAY

By default, our routers reboot at 3:30am every day. This clears out our router's cache and non-essential files.
